

Multidisciplinary Care in Atopic Dermatitis

Atopic dermatitis (AD) is a chronic, heterogenous inflammatory condition that is associated with characteristic cutaneous signs like redness, scaling, and oozing/weeping along with symptoms such as itch and pain. However, the burden of AD goes well beyond the skin. Did you know that AD is associated with:

- Allergic disorders, like asthma and allergic rhinitis
- Cutaneous and extracutaneous infections
- Ophthalmologic disease
- Mental health disorders, including anxiety and depression
- Sleep impairment
- Cardiovascular disease and obesity
- Musculoskeletal disease, such as osteoporosis and fractures
- ...And many other comorbid health conditions.

Given the immense burden of both atopic and non-atopic comorbidities, a multidisciplinary team-based approach is necessary to optimize treatment for AD patients. Join us at RAD to learn more about how dermatologists can work alongside other medical disciplines including allergy, ophthalmology, and sleep medicine to achieve the best outcomes. The RAD faculty represent the full spectrum of medical specialties and are here to show you how to revolutionize your care!
